AjourCollab

Ajour

Get full insight into the BIM project

AjourCollab is a collaboration platform which handles the ICT requirements of the project, building element data and the composition of offer lists with quantities.
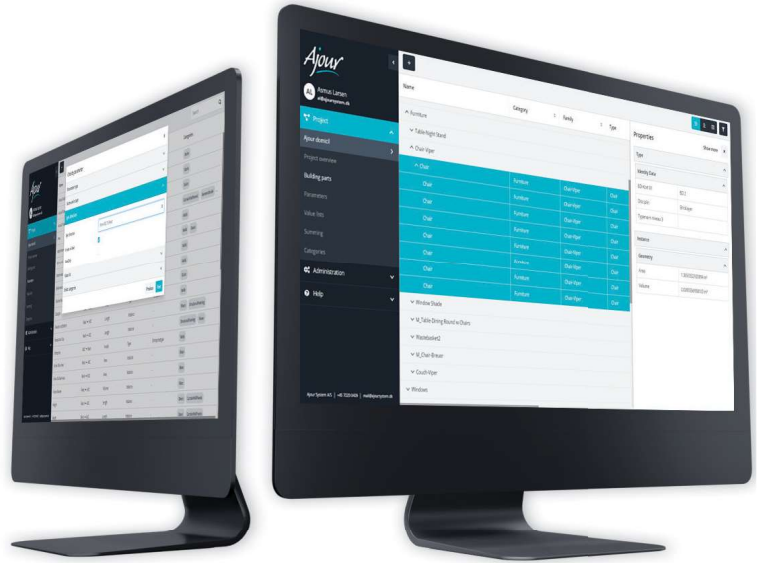

ICT - and data management

Synchronize your data and configure your ICT requirements from Revit to AjourCollab or vice versa. Work with BIM data in an external environment outside Revit – and get an overview of the properties and parameters of your project. Changes to building elements or quantities will be documented and logged into the system and they are drawn out of Excel quickly.
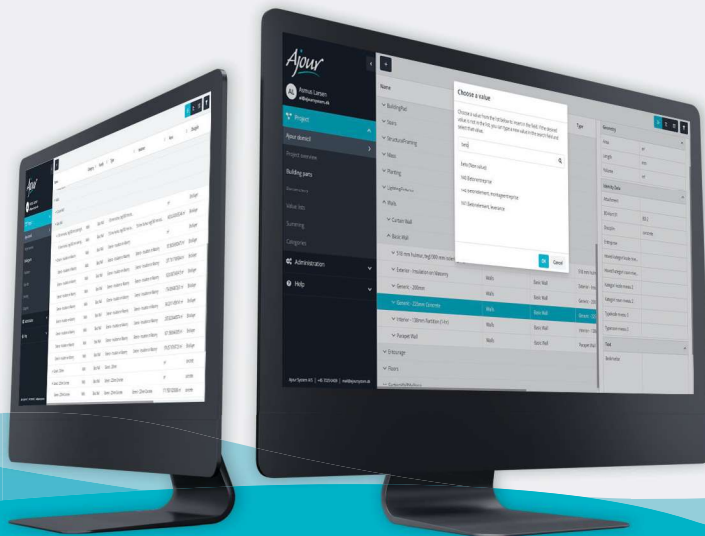

AjourCollab standardizes your workflow by means of an easier management of the property values of your project. Add value lists to specific parameters. The filling out of data is ultra-fast and safe. The BIM platform supports Keynotes and multiline text and it ensures that your drawing annotations are always updated.

You save time and may relax since you are sure of the ICT quality of your project.

Building element journal

A building element journal, which is always updated, may be more of a wish than reality. What is already part of the model and what has been added manually? It takes time to maintain and assure quality, however, now you have a place at which you can follow your project with change logs on quantities and properties on building elements.

With AjourCollab you get one place at which you can manage all your Revit objects and manual posts.
Filter the building elements and data of the project and get the exact view you are looking for – e.g. building element, category, classification or other parameters.

Tenderlist

Setting up tenderlists with and without quantities takes time and has many different forms and content. All your Revit objects with quantities are collected in AjourCollab. With just a few clicks you can export the lists to Excel in an optional sorting after e.g. contract, work- or building element parameter.
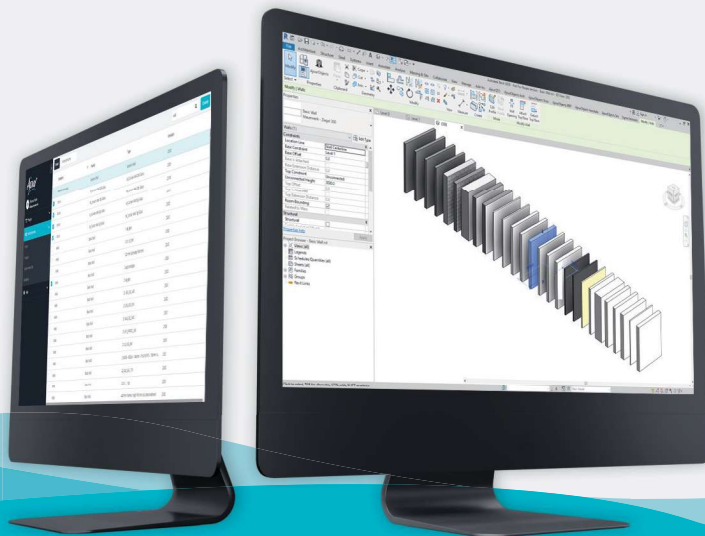

You may add manual posts in the form of regulation posts and options. Send the list to the bidder, use it as part of your tender in e.g. AjourTender. Compare offers.

You can compose your tenderlist quickly and precisely, and the construction will be priced on a correct and transparent basis.

Whitelist Concept

Are you challenged when preparing and distributing the right building elements for your new Revit project? How do you ensure that everyone is using the same approved content? Are you interested in simplifying and improving this process – and in following in which models your content is used?

What is a Whitelist Concept?
AjourObjects is integrated in AjourCollab. Select objects from your building element database in AjourObjects and make pre-defined "order forms" for elements which are to make part of your project.

With Ajour´s Whitelist concept you optimize the quality of your models and you save a lot of time.
